

Where Will Your Cloud Journey Start?

With businesses moving more and more workloads to the Cloud, what is the best way to start your Cloud journey?

Add Virtual Servers to Your Private Network

Putting your servers in the Cloud doesn't have to mean connecting to them over the internet. TPG Cloud can seamlessly integrate your Cloud services into your private network either by point-to-point link, or by integrating the Cloud into your IPVPN.

- Minimise, or eliminate all together, managing physical infrastructure.
- Integrate the Cloud in to your private network, without traversing the public internet.
- Expand into the Cloud for rapid provisioning of compute.
- Create server geographic diversity to improve availability of your applications.
- Reduce paying for idle computing resources.
- Pay for only what you need and scale as you require.

“Change the way you buy, but not the way you manage your IT.”

Once you are a customer on TPG Cloud you have the ability to rapidly scale compute resources to run more of your business applications.

This could include email, web servers, virtual IP-PBX, off-site backup server, testing and development, or disaster recovery.

Cloud isn't just the future...

It's here and now.
