

Where Will Your Cloud Journey Start?

With businesses moving more and more workloads to the Cloud, what is the best way to start your Cloud journey?

Replace an On-Site Small Business Server

Small business running an on-site SBS server? You can still reap the benefits of cloud. With TPG Cloud you can create a virtual server to replace your physical small business server. With inherent high availability, backed up storage, a virtual firewall and internet access, this solution means that there is far less hardware in your office, more redundancy, and it can be managed externally.

- Remove need to have on-site server, UPS, firewall etc.
- Improve redundancy – high availability and backed up, meaning less to manage.
- No long term contracts.
- As your business needs grow simply scale up the resources and only pay for what you need.
- A cost effective way to have your server in a resilient data centre as opposed to on site.

“Change the way you buy, but not the way you manage your IT.”

Once you are a customer on TPG Cloud you have the ability to rapidly scale compute resources to run more of your business applications.

This could include email, web servers, virtual IP-PBX, off-site backup server, testing and development, or disaster recovery.

Cloud isn't just the future...

It's here and now.
